

PowerTrade Fx2

General Information

PowerTrade Fx2 is a system that is based on taking short-term, high probability trades in the direction of the trend. The system uses different time frames and waits for those time frames to align before taking a trade. When the market is moving in the general direction of the trend, this system can rack up a lot of profits in a short-period of time. If the market is more range bound, it will most likely still be profitable during this time period, but it will be slower, with more time between profitable trades. PowerTrade Fx2 will also experience small drawdowns during this time. If the long-term trend reverses, PowerTrade Fx2 can suffer significant drawdowns before active trading begins to rack up the profits again.

No system works the same in all market conditions. PowerTrade Fx2 is no different. Aggressive trade size should be no bigger than a mini (0.1 lot) per \$10,000 across as many as 7 different currency pairs. The lower the spread in the pair, the better, but it has shown to work regardless. The worst case drawdown expectation for this situation is about \$7,500, but due to the high frequency of closed out profitable trades, it is extremely unlikely that this size of drawdown will occur prior to substantial closed out profits.

We are currently working on a version that closes trades out after a certain amount of time has passed without hitting the profit target. We will be testing this version in the coming weeks. However, if a trade has been open for 5 – 10 days without hitting the target, we have found it best to manually close out the trade so that it will free the system up to begin closing out higher probability profit targets on new trades.

We always believe there is room for improvement, and we are always striving to achieve that improvement. We will keep you informed on all improvements in the future.
